## Lower Class Limits Definition | Statistics

Tistats.com provides statistics formulas, definitions, example problems, ti-84 and ti84 tutorials, and upcoming podcasts.

### What is the class limit in statistics?

The minimum value is known as the lower class limit (LCL) and the maximum value is known as the upper class limit (UCL). For the frequency distribution of weights of 36 students, the LCL and UCL of the first class interval are 44 kgs. and 48 kgs. respectively.

## Statistics Examples | Frequency Distribution | Finding the ...

Class boundaries are the numbers used to separate classes. The size of the gap between classes is the difference between the upper class limit of one class and the lower class limit of the next class.

## Statistics Examples | Frequency Distribution | Finding the ...

The lower limit for every class is the smallest value in that class. On the other hand, the upper limit for every class is the greatest value in that class.

## What is the meaning of lower class boundary in statistics ...

In statistics the class boundaries are numbers that separate classes without forming gaps. To find the lower, you subtract 0.5 and to find the upper, you add 0.5.

## How to Find the Upper and Lower Limits of Class Intervals

If the class intervals of a variable are defined by whole numbers, to find the upper limit we add .5 to the highest

value specified by the category, and to find the lower limit we subtract .5 from the lowest value specified in the category. The limits of other numbers could be similarly determined. The table below provides some illustrations.

## **CLASS LIMIT AND CLASS BOUNDARY IN STATISTICS**

About "Class limit and class boundary in statistics" Class limit and class boundary in statistics : To understand class limit and class boundary in statistics, let us consider the frequency distribution of weights of 36 students given below.

### **Class limits**

Class limits, class boundaries, class marks. Class limits. There are two for each class. The lower class limit of a class is the smallest data value that can go into the class.

### **Statistics: Grouped Frequency Distributions**

Then continue to add the class width to this upper limit to find the rest of the upper limits. Find the boundaries by subtracting 0.5 units from the lower limits and adding 0.5 units from the upper limits.

### **Lower and upper fence calculator (statistics)**

What is lower and upper fence? The Lower fence is the "lower limit" and the Upper fence is the "upper limit" of data, and any data lying outside this defined bounds can be considered an outlier.
